Pavers and Retaining Blocks

Kimberley Retaining Wall System[™]

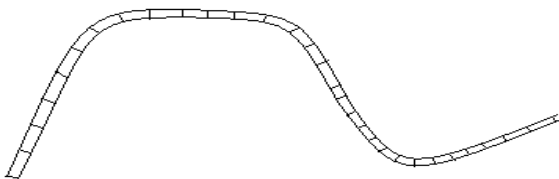

The old world charm of hand worked dry stacked stone as crafted by a stone mason. The smooth faced bevel edged blocks are easy to assemble, in a high strength concrete modular block system, that looks great in a formal garden and with its clean lines will enhance a modern garden just as well.

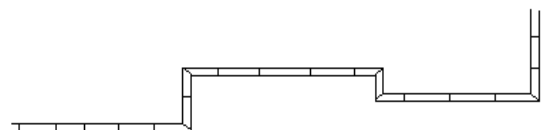

Standard Block Pattern

The **Kimberley** Retaining Wall[™] System makes it easy to construct convex or concave curves that will add grace, style and strength to any wall design. Corner / End blocks make it very easy to construct 90° corners which will provide added strength for a more formal wall design.

Note:- straight walls will always be weaker and more prone to falling over than walls with curves and corners

Curved Wall

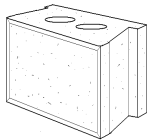

90° corners

The **Kimberley Retaining Wall™** System has three block sizes to allow a choice of patterns or can be constructed using just the one size. Matching capping and generous step blocks complete the system.

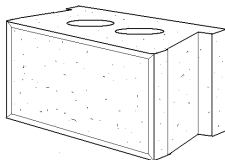

Free standing and parapet walls can also be constructed with the **Kimberley Retaining Wall™** system, simply by filling the cores with concrete and inserting reo bars as each row is stacked and bonded with a thin layer of tile adhesive.

The **Kimberley Retaining Wall™** System has been designed to integrate with the **Gammon Retaining Wall™** System so that the blocks can be mixed to create corner quoins or a feature base course to a retaining wall.
